Introduction

The Travel Booking System is a database-driven application designed to manage and streamline travel-related services such as customer bookings, travel packages, agents, and payments. In today's fast-growing tourism industry, maintaining organized and efficient data is essential for providing better customer experiences and smooth operations.

This system is developed using MySQL (MariaDB) and focuses on storing and managing information in a structured format. It allows travel agencies to handle multiple customers, create and manage travel packages, assign agents, and track bookings and payments effectively.

The database consists of five main entities:

- Customer – store details
- Package – contains travel package information
- Agent – manages travel agents and commission
- Booking – records travel bookings
- Payment – tracks transaction details

By using relational tables and foreign key constraints, the system ensures data consistency, integrity, and efficient retrieval of information.

System Features

The Travel Booking System provides several important features that make it efficient and useful:

1. Customer Management

The system stores complete customer details such as name, email, phone number, and address. Each customer has a unique ID, which helps in identifying and managing records easily.

2. Package Management

Travel packages like destinations, duration, price, and description are stored. This allows agencies to offer multiple travel options to customers.

3. Booking System

Customers can book packages, and each booking includes:

- Booking date
- Travel date
- Number of people
- Total amount

This helps in tracking all travel activities.

4. Agent Management

Agents who handle bookings are stored in the system along with their commission percentage. This helps in managing business operations.

5. Payment Tracking

The system records all payment details including:

- Payment method (UPI, card, etc.)
- Payment status (completed, pending)
- This ensures financial transparency.

6. Data Integrity & Security

Using primary keys and foreign keys ensures:

- No duplicate records
- Proper relationships between tables
- Accurate data storage

Database Schema

The database schemines the structure of the database and how different tables are organized.

Tables in the System:

Customer Table

Stores customer details:

- Customer_ID (Primary Key)
- Name, Email, Phone, Address, Password

Package Table

Contains travel package details:

- Package_ID (Primary Key)
- Package Name, Destination, Duration, Price, Description

Agent Table

stores agent information:

- Agent_ID (Primary Key)
- Name, Email, Phone, Commission Percentage

Booking Table

Central table connecting all:

- Booking_ID (Primary Key)
- Foreign Keys: Customer_ID, Package_ID, Agent_ID
- Booking Date, Travel Date, Number of People, Total Amount

Payment Table

Handles payment details:

- Payment_ID (Primary Key)
- Foreign Key: Booking_ID
- Payment Date, Amount, Method, Status

ER Diagram

Sample SQL Queries

-1. Create Database-----

```
CREATE DATABASE TravelBookingSystem;
```

2. Select Database-----

```
USE TravelBookingSystem;
```

3. View Tables

```
SHOW TABLES;
```

4. Fetch Customer Data-----

```
SELECT * FROM Customer;
```

5. Fetch Booking Details-----

```
SELECT * FROM Booking;
```

6. Insert Data-----

```
INSERT INTO Customer (Name, Email, Phone)  
VALUES ('Amit', 'amit@gmail.com', '9876543211');
```

7. Join Query Example-----

```
SELECT c.Name, p.Package_Name, b.Travel_Date  
FROM Booking b  
JOIN Customer c ON b.Customer_ID = c.Customer_ID  
JOIN Package p ON b.Package_ID = p.Package_ID;
```

Future Scope

The system can be improved further by adding advanced features:

01

Online Booking Platform

The system can be upgraded into a full web-based application where users can search and book travel packages online in real time.

02

Payment Gateway Integration

Integration with secure payment methods like UPI, debit/credit cards, and net banking to enable smooth and instant transactions.

03

User Authentication & Security

Adding login systems with encrypted passwords to improve data security and protect user information.

04

Mobile Application Development

Developing a mobile app version of the system to provide easy access and booking सुविधा anytime and anywhere

CONCLUSION

The Travel Booking System demonstrates how a well-designed database can efficiently manage real-world travel operations such as customers, packages, bookings, and payments. By implementing the system using MySQL (MariaDB), data is stored in a structured and reliable manner, ensuring accuracy and consistency.

This system reduces manual effort, minimizes errors, and improves the overall efficiency of managing travel services. It also provides a scalable foundation that can be expanded into a full-fledged online booking platform with advanced features.

In conclusion, this project highlights the importance of database systems in modern applications and shows how technology can simplify and optimize business processes in the travel industry.

THANK YOU!
